# TOP-LEVEL CYBERSECURITY AND ENCRYPTION SOLUTIONS

**Crypto helps keep societies and organisations around the globe more secure by safeguarding critical assets through top-level cybersecurity and encryption. Our solutions are independent, thoroughly proven and easy to use in the field.**

Active in more than one hundred countries, Crypto focuses exclusively on international operations. Since 1 February 2018, the Swedish cybersecurity veteran and entrepreneur Andreas Linde is the new owner of the company. Crypto now bundles Swiss-Swedish innovation spirit and engineering proficiency to develop tailor-made and reliable solutions that protect critical assets of national importance.

## **Roots dating back a century**

Ever since the 1910s, Crypto has stood for independent expertise, innovation and discretion. Our history sets us apart from others with years of experience and solid professional knowledge. The Crypto security architecture opens up the full potential of cryptographic possibilities with customer-specific algorithms, the autonomous profiling of customer-managed parameters and highly secure implementation into hardware. Our aim is to offer tailor-made solutions that anticipate cybersecurity trends at an early stage.

## **Unrivalled competence**

Top-level cybersecurity and encryption solutions require early anticipation and constant engagement with technological developments. This is the only way to ensure that security gaps are identified at an early stage and eliminated through long-lasting solutions.

Since Crypto was founded, communication technologies have transformed beyond all recognition – from mechanical and electronic systems to the totally networked and interconnected IT of our digital era. In the face of this progress, driven by Swiss engineering proficiency and Swedish

innovation spirit, the company has always stayed ahead of the curve, using the insights it gains to develop high-quality solutions.

Whether in civil society or the military, Crypto's tailor-made cybersecurity and encryption solutions satisfy the toughest requirements for networks as well as for stationary or mobile workstations.

### **Crypto goes cyber**

The topic of cybersecurity is becoming increasingly important, especially in the governmental sector as the totally networked and interconnected IT of our digital era affects all aspects of life or how we work. Be it our own digital devices such as mobile phones, notebooks or Internet-connected parts of a nation's critical infrastructure. Therefore, effective cybersecurity is an absolute must to preserve and protect the sovereignty, security and stability of a country. There is an increasing awareness in this regard, as well as in the prevalence of attacks and their likely consequences.

### **Top-level cybersecurity and encryption**

The encryption of sensitive and / or classified information while it is being transmitted and stored forms an integral part of cybersecurity. To prevent an ICT infrastructure from cyberattacks and to keep up network health, it is essential to anticipate cybersecurity trends at an early stage. The fast identification of vulnerabilities, their prioritisation and the immediate response to security incidents are absolutely crucial. Therefore, Crypto's experienced teams of engineers specialised in IT, project management, implementation and services work out cybersecurity and encryption solutions in close collaboration with the customers' specialists.

### **Customer-specific and user-friendly**

Today's security challenges faced by ICT infrastructures cannot be solved by technology alone. This is the reason why Crypto focuses on a holistic approach to cybersecurity and takes into account the dimensions of processes and people. In this context, technology supports and facilitates the defined processes, enables the control and monitoring of physical access to facilities as well as the encryption of classified information.

Thanks to its outstanding innovative capacity coupled with a century of experience, Crypto has become one of the world's leading companies in the field of cybersecurity and encryption with an offering to meet the increasingly complex cybersecurity needs of international customers.

## Company location

The Swiss-based company location of Crypto International Group in Steinhausen / Zug, Switzerland.
